

Transmission Improvements Group

June 24, 2015

Flow-Based ATC

- Proposal being developed to address disconnect between commercial model and physics of system
- Underlying principle – leave existing rights in place
- Still very much a work in progress
 - Need for more specific information regarding injections and withdrawals
 - Many forums have produced good technical ideas about how to approach (BPA, GridWest, MAPP, etc.)
 - Evaluating what to bring over from those efforts
 - Whatever is brought over needs to be within TIG framework (no FERC jurisdiction)
- Group intends to break into increments and identify the costs and benefits of each increment
 - More coherent operation
 - Basis for better reliability protocols
 - Facilitation of redispatch process
 - New rights (charter says proposal will address new rights)
